

```
app.use(session(sessionOptions));  
app.use(flash());  
const app: Express  
app.use(passport.initialize());  
app.use(passport.session());  
passport.use(new LocalStrategy(User.authenticate()));  
passport.serializeUser(User.serializeUser());  
passport.deserializeUser(User.deserializeUser());
```

Whenever we use passport for authentication and authentication this is imp to write understand its meaning from passport lib and also to use passport session is req.

Session is interaction between user and client, diff tabs mean same session but diff browser make diff session use.
